Abstract (en)

[origin: ES293016U] The device comprises a roasting drum turning about its longitudinal axis, annular chambers arranged next to one another, which are open at the top and are delimited by chamber walls arranged at a distance from one another, a main tube for conveying roasting gas extending coaxially in the roasting drum, this tube having roasting gas nozzle tubes for generating a fluidised bed of the coffee beans to be roasted. The device is characterised in that, between the annular chamber walls (12, 12'), delimiting elements (14, 14') extending into the annular chambers (10, 10') are provided as a lateral limit of the fluidised bed generated by the respective set of roasting gas nozzle tubes (8), which are secured on the main tube (6) conveying the roasting gas.
