Abstract (en)

[origin: EP0195979A2] Using the recording material which contains, in a common binder layer, in the form of separate complex coacervates a plurality of coordinations of different spectral sensitivity, consisting of a) a silver halide, if appropriate in combination with a non-photosensitive silver salt, b) a dye donor and c) if appropriate, further auxiliaries, and which has a yellow filter layer above the said binder layer, a blue-sensitive coordination being more sensitive by at least 0.5 log I.t units than the other coordinations, dye images having improved colour separation are obtained by heat-development.
