Abstract (en)

[origin: EP0196491A2] A device for the simple sharpening of knives that are essentially circular concave, having an abrasive body rotating about an axis of rotation and attached to a holder and having a drive device, is characterised in that the holder can be rotated about at least two axes which are perpendicular to one another and do not lie in a common plane, the distance between the two axes can be varied via a connecting element, the connecting element is connected to the holder in such a way as to be rotatable relative to the latter about the first axis, and the connecting element together with the first axis and the holder is arranged so as to be pivotable about the second axis. <IMAGE>
