Abstract (en)
[origin: EP0197248A1] 1. A concrete beam mould (1) including form panels (2) for the approximately vertical side faces of the beam and further including a lower cross girder (6) for holding an approximately horizontal formwork face (7) for the underside of the beam, said cross girder (6) protruding laterally with its ends (6a) beyond the vertical form panels (2) and in each of its protruding end areas (6a) having a stiffening (8) extending upwardly into the region of the form panels (2), at least one stiffening (8) being adjustable on the cross girder (6) in the longitudinal direction thereof, characterized in that the stiffening takes the form of a flange (8) having at least one fastening location (5) for connection to marginal webs (4) which are disposed at the edges of the form panels (2) and are at approximately right angles to the formwork face of the latter, the fastening location (5) of the flange (8) corresponding to those of the marginal webs (4), and that directly above the cross girder (6) connecting the flanges (8) the latter have at the edge areas facing one another a recess (16) open at the edge side for overlapping the transversely extending lower marginal web (4) of the vertical form panels (2), so that the flanges (8) reach up to near the reverse of the formwork face (3) of the form panels (2) provided with marginal webs (4).
