Abstract (en)
[origin: EP0197259A2] 1. Double-cylinder sweeping machine having two sweeping cylinders arranged with parallel axes to one another on a chassis or carrier frame, which cylinders are pivotable in common through at least 90 degrees out of a working position extending obliquely of the direction of travel into a second working position extending in mirror image thereto, by means of a bogie on which they are vertically movably secured, characterised in that the two sweeping cylinders (1, 1') are arranged offset in relation to one another in the direction (20) of travel by at least an amount corresponding to the diameter of a sweeping cylinder (1, 1') in a bogie (2) raiseably and lowerably articulated by means of hoist links (3) to a working vehicle and are shiftable by means of parallel guides (6) in the direction of their own axes out of a working position in which they are offset in relation to one another by their axial length into a rest position in which they lie parallel side by side within the bogie without axial offset.
