Abstract (en)

[origin: EP0197575A1] A method and apparatus for dispensing a viscous liquid using a valve comprising a body having an inlet (2) and an outlet (3) and a valve member (4) movable perpendicularly to the plane of said outlet. According to the invention, as soon as virtually the entire desired quantity of liquid has passed the outlet the valve member is moved to the outlet at a high velocity, so that the last quantity of liquid is pushed through the outlet, and the valve member is suddenly decelerated by a shoulder of the valve striking a valve seat.
