Abstract (en)

[origin: WO8602100A1] A protein having erythroid potentiating activity (EPA). The EPA protein has a biological activity of at least about 10<6> units per mg of protein and has an apparent molecular weight of about 28,000 daltons as determined by SDS-PAGE analysis on 10 percent polyacrylamide gel. Also described is a cloned EPA gene coding for such EPA protein, a recombinant vector containing the EPA gene, a microorganism or mammalian cell transformed with such a recombinant vector, and a method for producing EPA by expressing said EPA gene by culturing said microorganism or mammalian cell. Purified EPA stimulates the growth of both early and late erythroid precursors from human bone marrow, as well as colony formation by the K562 erythroleukemia cell line.
