Abstract (en)  
[origin: EP0198489A2] In a fuse holder for use in switchboards and conductor rail systems and comprising a socket part (10) having mounting means for mounting contact parts (13) and terminal parts (15), the socket part (10) is in each end provided with a vertically through-going recess (33) and an longitudinally extending screw- or bolt hole (47) ending in the recess. The recess (33) is on the rear side of the socket part (10) provided with a transverse partition (45) forming a clearance (44) for a nut part (41), which together with a mounting screw (43) and a washer (53) allows fastening of the contact parts and the terminal parts to the socket part. This through-going recess in each end of the socket part increases the number of applications considerably, as there is now also a possibility of power supply and power discharge on the rear side of the holder. The fuse holder is further provided with a cap (70) for covering a contact part. The cap (70) is constructed in such a manner that no contact can be established to live parts by means of a DIN-standardized test digit.
