Abstract (en)
[origin: EP0199442A2] In the first place, inputted from a key switch portion (29) is a personal identification code for a person to use the exerciser. In response to this, personal data corresponding to the identification code are read from the storage means, to be set as the user's data. Thereafter the user performs exercise by driving a load unit (8), whereby data on the user's pulse are successively supplied from a pulse sensor (22) to a microcomputer (24). The microcomputer (24) controls the load level of the load unit (8) on the basis of the user's personal data as set in the aforementioned manner and changes in the pulse rate data during the exercise, thereby to adjust conditions of the exercise that can be performed by the user in accordance with the situation and desired conditions of the user's exercise.
