Abstract (en)
[origin: EP0200039A1] 1. Industrial truck consisting of a chassis and load-receiving means fastened thereupon, wherein a counting mechanism (1) that counts the work operations, is in connection with at least one detector, which registers the forward and/or reverse travel and at least one additional detector that registers the raising and/or lowering of said load-receiving means, the control of said counting device is effected by a microprocessor, which connects the detectors signals for the individual actions of said industrial conveyor, whereby after one individual action further individual actions of the same kind within a cyclical work process are not considered, and a count of said cyclical work process is made only after completion of said cycle.
