Abstract (en)

[origin: EP0201729A2] The device permits not only the production of cylindrical portions but also of conical portions. In addition, the invention claims protection for a correspondingly shaped conical tube. Conical tube portions are formed by virtue of the fact that the series of rolls containing the two driven rolls which roll on one another and containing the back-pressure roll is pivotably arranged and that guide rolls gripping the respectively most recent turn on the outside and on the inside are adjusted to the changing diameter. This is preferably accomplished with the aid of an electric circuit, for example in the form of a microprocessor. <IMAGE>
