Abstract (en)

[origin: EP0202186A2] A direct-flushing fluid filter comprises a filter body (20) disposed within a housing (2) and defining a first plurality of parallel flow paths (44) from the housing inlet (10) to the filtered fluid outlet (12), and a second plurality (42) of parallel flow paths from the housing inlet to a dirt-purging outlet (14, 16). Each of the first flow paths (44) includes a filter passageway for removing dirt particles, and an inlet chamber (32) on the inlet side of the respective filter passageway for accumulating the dirt particles. Each of the second flow paths (42) connects the inlet chambers (32) to the dirt-purging outlet (14, 16) while bypassing its respective filter passageway. The filter further includes a valve (50, 52) between the second flow paths (42) and the dirt-purging outlet (14,16), which valve is normally closed but is opened to effect a cleaning of the filter by directly flushing the dirt in the inlet chambers (32) through the second flow paths (42) to the dirt-purging outlet (14,16).
