Abstract (en)

[origin: WO8602862A1] Internally chilling aluminum alloys, FRM, steel, Ti alloys, Ni alloys, Co alloys and the like by the use of aluminum alloys. In internally chilling highly strong materials such as ferrous ones or the like by the use of aluminum alloys, the alfin method has heretofore been employed not to leave non-plated portions by plating of aluminum. It requires, however, cumbersome operation and increased cost. This invention improves the above defects by employing vibration plating instead of said aluminum plating, and by forming a uniformly plated layer with excellent junction properties. The invention is adaptable to engine parts such as cylinder heads, pistons, etc., as well as to gears.
