Abstract (en)

[origin: WO8603162A1] A method of setting the operational conditions for an injection molding machine, which is capable of setting variously a plurality of operational conditions for the injection molding of a material in the injection molding machine without rewriting a numerical control program for use in controlling the injection molding operation. A numerical control program for use in controlling a plurality of operational conditions is prepared by using macro variables. A value for each operational condition is set relatively to the corresponding macro variable, and each set value is stored in an address, which is determined in accordance with a relative macro variable, on a memory (5). During an injection molding operation, a corresponding macro variable in the program is read, and the injection molding operation is controlled in accordance with a set value.
