Abstract (en)
[origin: WO8604044A1] A dispenser for closures has a means for ejecting an end-most closure contained in a pivotably mounted housing (1) for closing a bag. The closures (4) are formed with a hole (41) and a cut (43) leading from one side to the hole. In one embodiment, the dispenser is wall mounted such that a weight means (118) may be used for feeding closures to a dispensing position. A second embodiment uses a spring feed (20) for urging the closures to the feeding position. The housing is formed with facings slots at the front end thereof, a pusher (17) being mounted on a base member. When the housing is pivoted toward the base member, the pusher extends through one slot to displace the end-most closure through the other slot. The dispenser may include cams (127, 128) on either side of the dispensing slot for spreading the portions of the closure on each side of the cut, thereby facilitating application of the closure element to the neck of a bag.
