Abstract (en)  
[origin: EP0206129A2] A method for the complete inversion of magnetization by adiabatic fast passage during an NMR experiment on a sample having a selected nuclear specie with a Larmor frequency  $\omega_o$ . A radio-frequency magnetic field is generated with an amplitude  $B_1$  and an instantaneous frequency  $\omega(t)$  which is non-linearly swept, as a function of time, from a minimum frequency  $\omega_1$  substantially at a maximum offset frequency  $\Delta\omega$  below the Larmor frequency  $\omega_o$ , through the Larmor frequency, to a maximum frequency  $\omega_h$  substantially at the maximum offset frequency  $\Delta\omega$  above the Larmor frequency. The non-linearly swept, monotonic RF signal is applied to the sample-being-investigated for a sweep time interval sufficient to invert the magnetization of the selected nuclear specie. The preferred sweep is a tangential function: or  $\omega(t) = \omega_o \pm \gamma B_1 \tan(\omega_s t)$  where  $\omega_s = \gamma B_1$ ,  $\gamma$  is the gyromagnetic ratio of the selected nuclear specie and  $0 < \alpha \leq 1$ .
