Abstract (en)

[origin: EP0208304A2] The device consists of two fitting parts which are arranged on the leaf on the one hand and on the window or door jamb on the other hand and of which one has a coupling piece and the other a housing with a catch recess for the coupling piece. In the housing, there is a blocking slide, releasable manually counter to the force of a closing spring, for locking the coupling piece engaging into the catch recess, and the coupling piece, when introduced into the catch recess, forms an actuating member for transferring the blocking slide into a catch position engaging behind the coupling piece. <IMAGE>
