Abstract (en)

[origin: EP0209802A2] In a method for transferring patients between a septic area (2) and an aseptic area (3), the patients are placed on a ward bed (14) and introduced into a sluice room in such a way that the lengthwise side of the bed (14) comes to bear on the lengthwise edge of a transfer bench (7) arranged at the same height. This bench (7) is situated above a parapet (1) dividing the sluice room into two areas. When the patient (15) is lying on the transfer bench (7), the latter is moved horizontally away from the ward bed (14) and is raised to the level of an operating table (23), which is situated on the other side of the parapet (1). The patient (15) is then moved from the transfer bench (7) to the operating table (23) without changing the vertical position. The transfer bench (7) sits on a horizontally moveable carriage (17), which in turn is arranged on a vertically moveable carriage (18). Both carriages (17, 18) are moved via cylinders (19, 20) (Fig. 2). <IMAGE>
