Abstract (en)
A device is disclosed which is designed to permit the sorting of sheets of significantly-greater area than the sorter bin support surface, without the projecting area of sheet bending over the bin edge and potentially interfering with the introduction of new sheets into adjacent bins. Each bin surface (4) is provided with wings (8; 10) to induce a curve into a sheet (24) being fed and stored in a bin (2), so as to give the sheet sufficient beam strength for the projecting portions to remain aligned with the portion of sheet which is in the bin.
