Abstract (en)
[origin: WO8604291A1] The new support comprises a bar (1), jaws (2) and an extremity part (3) at each end of the bar. The extremity parts hold together the jaws which are arranged between them. Said jaws are each formed by a band of elastic material curved with a U configuration. The ends of said bands form feet which are engaged in the bar (1). The feet are displaceable in the longitudinal direction of the bar so that the introduction of a tool or instrument between the two jaws causes their spacing and the uniform distribution of the pressure on all the jaws. The support is thus capable of receiving tools and instruments of different thicknesses and shapes and to safely hold them due to the pretensioning of the jaws and to the progressive elasticity of the flanks from the feet up to the curved medial portion.
