Abstract (en)  
[origin: EP0211096A1] 1. Power-controlled hydraulic pump having variable displacement volume and the following features : an adjusting member (4, 7, 10) having a servo piston (7) is provided for adjusting the displacement volume (Q) ; the servo piston (7) is displaceable by control pressure (Pc ) against the effect of a return means (10) ; the return means (10) is designed in such a way that a certain level of the control pressure (Pc ) corresponds to each position of the servo piston (7) ; a control valve (20) controls the level of the control pressure (Pc ) and to this end has a control member (22) having a first control piston area (A1) which is acted upon by the working pressure (Ps ) against the force (F1) of a valve spring (28), and a second control piston area (A2) which is acted upon by the control pressure (Pc ) against the effect of the first control piston area (A2), characterized in that the return means (10) contains one or more springs (15, 16) in order to produce a progressively increasing total return force during adjustment for smaller displacement volumes (Q), and in that the second control piston area (A2) is larger than the first control piston area (A1).
