Abstract (en)

[origin: EP0211313A1] 1. Method of winding a web onto a winding core of a winding station, in which the web, with an angle of contact of less than 180 degrees, is guided around a contact roller (5) which bears against a rotating winding of the web, characterized in that the tensile force  $F_b$  in the web is continuously measured and is added to a predetermined contact force  $F_p$ , with which the contact roller bears against the winding, to result in a force  $F$  with which the contact roller is pressed against the winding.
