Abstract (en)

[origin: EP0211747A1] The assembly comprises, in combination: - at least one self-propelled carriage (2) capable of being displaced automatically between the payment machine (1) and the processing station, this carriage (2) being equipped with a container (3) having in its upper part an entry orifice (4), by way of which the coins are introduced inside, and in its lower part a flap, the controlled opening of which makes it possible to discharge the contents of the container at the processing station; and - at least one buffer reservoir (6) which is located on each payment machine (1) and by way of which the coins introduced into the machine pass, this reservoir (6) making it possible to retain the said coins temporarily during the displacements of the carriage (2) towards the processing station and ensuring that these coins pass directly towards the container (3) of the carriage when the latter is stopped under the payment machine (1).
