Abstract (en)

[origin: EP0212313A1] 1. A vacuum cleaner with an arrangement for the releasable connection of the connecting nozzle (6) of a suction hose in a suction opening (5) provided in the vacuum cleaner housing (1), in which arrangement at the tubular end (7) of the connecting nozzle (6), which can be introduced into the suction opening (5) and which is rotatably mounted in said suction opening, an annular chamber (13) is formed, in which a locking device (14) is arranged, which under the effect of spring tension, which comprises a release button (20) and which can be locked with corresponding counter elements in the suction opening (5), characterized in that the annular space (13) is formed by a tube connection (9), which is open towards the tubular end (7) of the connecting nozzle (6) and which encloses said end (7) concentrically; in that the releasably secured locking device (14) comprises a resilient annular part (15) which encloses the tubular end (7) and at whose outer circumference a locking cam (16) is provided, which projects radially outwards which passes through a slot (17) in the wall of the tube connection (9) and which engages in a circumferential groove (18) formed in the wall of the suction opening (5); in that the release button (20) projecting through an opening (19) in the wall of the tube connection (9) is arranged on the annular part (15) at an axial distance from the locking cam (16); and in that the annular part (15) is secured against the wall of the tube connection (9) in the axial direction of the connecting nozzle (6) and in a radial direction in the region of the locking cam (16) and on the side opposite to the locking cam (16) is braced against the wall of the tube connection (9).
