Abstract (en)

Mining method with the application of waste materials as filling medium which, enables roof-fall mining under a surface requiring protection. Surfaces of mining beds are divided into areas whose sides are approximately equal to the length of fronts of wall headings, and then in points of intersection of diagonals of the said areas vertical or skew holes are drilled for forcing in impurities with water into voids or delaminations formed in the rock mass, at the vertical distance determined by lithology of rocks and distribution of the horizontal component of stresses.
