Abstract (en)

A composite material is made from alumina - silica type short fibers embedded in a matrix of metal. The percentage fiber volume proportion X % of the alumina - silica type short fibers is between approximately 5% and approximately 50%. The metal is an alloy consisting essentially of a percentage Y% of copper and remainder substantially aluminum. And the inequalities $Y \leq -0.00092X + 7.85$ and $Y \geq -0.00092X - 0.0094X + 3.55$ are satisfied. The fiber volume proportion of the alumina - silica type short fibers may more desirably be between approximately 5% and approximately 40%. And the alumina - silica type short fibers may be alumina short fibers, or alternatively may be crystalline alumina - silica short fibers, of which the mullite crystalline amount may be at least about 45%. Or the alumina - silica type short fibers may be amorphous alumina - silica short fibers.
