Abstract (en)

[origin: WO8604825A1] A cross-country ski binding in which the shoe (2) is attached to the ski (7) by means of a device with a binding component (3) which permits the foot to swing laterally about an axis (1) which is diagonal to the forward movement of the ski. The axis of movement runs through a point on the inner side of the ski (4) which is relatively far from the ski point (8) and through a point on the outer side of the ski (5) which is nearer to the ski point (8). Thus the axis of rotation (1) is preferably located beneath the hypothetical axis of rotation (6) of the metatarsophalangeal joints, rising towards the outside by an angle between 5° and 20° from the upper surface of the ski.
