Abstract (en)
[origin: US4763965A] The invention provides a printer table with a paper carriage, such that, at least, four grades of paper can be held in readiness without difficulty, each of them properly arranged for feeding. The paper carriage is able to be inserted beneath the printer table. The printer table has a bottom frame, open at one wide side, with a traverse element at the opposite broadside (or wide side) and vertical posts at the four corners of the bottom frame. The width of the paper carriage corresponds to the distance between the two posts which define the limits of the open wide side of the printer table. The paper carriage includes one bottom or base plate or a plurality of bottom, or base, plates having raised edges.
