Abstract (en)  
[origin: EP0215160A1] A hand-grenade pin has a hook-like part (3), which is the locking part, which extends over the handle of the hand-grenade and secures the arm part (1) when it is inserted through openings in the handle and body of the hand-grenade. A pulling ring (2) is adapted to be positioned relative to arm part (1) so as to engage with a protrusion (5) at the bend in the hook-like part (3) to secure the hand-grenade during transit and prevent inadvertent withdrawal of arm part (1). Pulling ring (2) is coupled to loop (4) and snaps over protrusion (5). Extending and then twisting the pulling ring (2) enables the hook-like part (3) to be released from the arm part (1) such that the arm part (1) may be withdrawn with a force which is consistent from one such hand-grenade pin to another.
