Abstract (en)
As discussed in our Australian Patent 524616 over recent years and with the advance of technology many improvements have been made to the construction techniques in saddlery and in the materials used. Many years ago saddles were constructed by building up or adding on various saddle components to what was a conventional wooden saddle tree. With the advance of technology we saw the introduction of saddle trees formed from rigid plastics material and when thin light racing saddles were required the insertion of thin carbon rods or straws. The carbon rods giving the desired strength to the saddle tree. Developments of this nature saw the saddle tree being formed complete with seat cantle and pommel.
