Abstract (en)
[origin: WO8605034A1] This invention is roughly divided into two, i.e., a film in which a pattern is formed by providing one main surface of a flexible insulating film (1) with a first metallic film (2) which consists of one kind of metal chosen among copper, silver, nickel and aluminum, or an alloy thereof, a second metallic film (3) consisting of one kind of metal chosen among nickel, chromium, tungsten and silver, or an alloy thereof, a third isotropic conductive film (4) consisting of carbon powder and synthetic resin, and a fourth anisotropic conductive film (7a) consisting of carbon powder and synthetic resin; and an anisotropic conductive bonding agent. Owing to the functions of these products, a film connector capable of reliably carrying out the electrical connection of even the high-density terminal leads, and having an improved reliability can be obtained.
