Abstract (en)  
[origin: EP0216219A2] The container, which is suitable for transporting and storing radioactive materials, essentially consists of a reinforced concrete wall (1) which is clad on the outside by a steel plate (2) and on the inside by a steel plate (3) which is thicker by a multiple than the steel plate (2). A container opening (4) on the end face can be sealed by a reinforced concrete lid (7) which consists of a concrete core (8), which is enclosed by a cladding (9), a cover (10) and permanent formwork (11). The cover (10) projects beyond the reinforced concrete lid (7) such that it is possible to introduce into bores (13) arranged uniformly distributed over the circumference of the cover (10) screw bolts which can be screwed into tapped bores (6) of threaded anchors (5) which are attached to the steel plate (3) on the side facing the reinforced concrete wall (1). <IMAGE>
