Abstract (en)
[origin: EP0216654A1] 1. An apparatus for the functional rehabilitation of the upper and/or lower limbs of a handicapped person, comprising a series of transmission elements hinged on one another by spindles (3, 8) and guide sprockets (A, B), from a drive element to an end element carrying the rehabilitation mechanism for the upper limbs passing through an intermediate element carrying the mechanism for the lower limbs, characterised in that it comprises means for adjusting the position of the two rehabilitation mechanisms formed by two horizontal telescopic struts (13) disposed one above the other, which struts are adjustable for height on a vertical support (19) and which each support at their free end one of the transmission elements.
