Abstract (en)
[origin: EP0217154A2] The drawer, in particular a drawer for chemist's specialities, has at least one transverse partition which is held by the bearing wall of the drawer and comprises a partition tab and, at one end of the latter, a U-shaped bar, which is open at the bottom, overlaps the bearing wall and is widened in the manner of a flange. Furthermore, the transverse partition engages with a vertical catch element in a fastening provided on the bearing wall, which fastening consists alternately of vertical webs and grooves. In order to be able to place the transverse partitions quickly and easily on the bearing wall, to remove them again and to ensure that, during operation, the transverse partitions remain undisplaceably fixed, provision is made for the webs of the fastening to extend in an upward plane up to a horizontal bend edge and from there to be bent back downwards with formation of an acute-angled dome. Provision is also made for the transverse partition as a catch element to have at least one vertical strip which is known per se and is situated on the inside of the U-shaped bar. <IMAGE>
