Abstract (en)
[origin: EP0217777A1] 1. A heat pipe comprising a heat exchange surface and at least a permeable partition forming a plurality of passages with the heat exchange surface, characterized by the or each partition (3, 4...) extending along a surface which joins said heat exchange surface (1) at regularly spaced intervals (A, B, C...) so as form with said heat exchange surface a number of capillary passages (10, 20, 30...) having the joining lines (A, B, C...) as lateral ends, said capillary passages having acute angle corners (101, 102, 201...) along their lateral ends, and by the or each partition (3, 4...) being formed with openings (6) having a diameter or a width (d) at least substantially equal to the maximum height (E) of a capillary passage.
