Abstract (en)

[origin: EP0219444A1] 1. Wood splitting machine comprising a threaded cone (14) with a horizontal rotation axis revolving above a table, and characterized by the fact that it also contains a fixed tube (15) which is parallel to the cone axis (14) and in which the sliding part of an arm (17) is fixed, whereas the other part of the arm is bent and has its end (19) facing the cone tip (14), this end (19) moves from a position very close to the tip to a position far from it when the arm (17) slides in the tube (15), whereas a device holds the end in question (19) on the cone axis (14) during the sliding and a spring (20) continually returns this end (19) to the position very close to the tip.
