Abstract (en)
[origin: US4724969A] The invention provides a clothes drying apparatus with a central post member, a collar member axially displaceably mounted on the supporting post member and a plurality of support arms. A plurality of clothes line portions extend between the support arms. Operating means are provided to spread the support arms from a rest position into an extended position in which the clothes line portions extending between the support arms are in an essentially tensioned condition. In order to avoid a contamination and muddling of the hanging down line portions when the apparatus is in its inoperative position, cavities are provided between the central post and the support arms which receive and protect the hanging down line portions. For this purpose the support arms are provided with rigidly or pivotally mounted blade members which cover these cavities.
