Abstract (en)

[origin: EP0219630A2] The invention relates to a device and method for collecting a predetermined number of sheets. Hitherto, the state of the art has worked with horizontal slides which have had to be moved to and fro, thus leading to considerable time losses in the extremely rapid intermittent mode of operation. The invention affords a remedy for this in that it provides two wing-like sections or turnstiles which are mounted rotatably at a distance from one another at the exit of a first station and which are equipped with a synchronous drive for a uniform oppositely-directed rotational movement, thereby making an intermittent transfer of sheets from the first station to a second station possible. <IMAGE>
