Abstract (en)
[origin: EP0220425A2] The device has a neck opening by which the human body, held only by the head, can float in water. In order to provide chin, nape and the lateral neck portions with good support and comfortable bearing the neck opening is arranged eccentrically relative to the outer circumference, resulting in a bearing surface adjusted to suit chin and nape due to different cross-sectional areas of the annular device. <IMAGE>
