Abstract (en)
[origin: US4720665A] A transducer for converting electrical input signals into an electrical or mechanical output. The transducer employs a circuit for producing a negative source impedance and a winding cooperating with the circuit. The winding has first and second parts connected end to end. The ratio of the induced electromotive forces developed across the first part relative to that of the second part differs from the ratio of the ohmic resistance of the first part relative to that of the second part.

Abstract (de)
Bei einem Wandler (45) zur Umwandlung elektrischer Signale in elektrische oder mechanische Signale mit Hilfe einer Wicklung (50) und einer Schaltung (60) zur Erzeugung einer negativen Quellenimpedanz, wird die Wicklung (50) derart in zwei Teile (53, 56) aufgeteilt, dass das Verhaeltnis der induzierten elektromotorischen Kraft in den Teilen nicht gleich ist dem Verhaeltnis der ohm'schen Widerstaende in den beiden Teilen.
