Abstract (en)

[origin: EP0222060A2] A device comprises a UV radiation source and a reflector. The reflector preferably consists of two parabolic or elliptical half-shells. One or more coatings for the reflection of UV radiation and, underneath, a coating for absorbing the longer-wavelength part of the spectrum of the UV radiation source are provided on the reflector surface. A diffusion barrier layer is arranged between these coatings. The reflection layer consists of alternately low-refracting dielectric layers of SiO₂ and high-refracting layers of HfO₂, the diffusion barrier layer consists of a dielectric layer of SiO₂ having a physical thickness of at least 0.5 μm and the absorption layer consists of a black anodically oxidised layer, black chromium- or nickel-plating, anodisation or bronzing of a polished copper coating or nickel coating of the reflector body consisting of aluminium alloy. <IMAGE>
