Abstract (en)

[origin: US4719325A] For receiving the contact levers of a contact arrangement, a holder is provided, in which the contact levers are supported so that they can be tilted relative to each other. The holder in turn can be moved in a stationary bearing strap for switching on and off. The bearing strap consists of two mirror-symmetrical angles which are assembled to each other by connecting straps at an unchangeable distance corresponding to the width of the holder. The connecting straps are preferably provided with openings into which material of the angles can be pushed by plastic deformation.
