Abstract (en)

[origin: EP0222708A2] The invention consists in a control panel for the automatic and manual control of a window winder, particularly for motor vehicles, comprising a box-like body closed internally by a rigid printed circuit, and supporting at least one push button for actuating a manual movable contact and an automatic movable contact. The push button can slide against the action of a first elastic element to carry the manual movable contact into contact with the printed circuit, and against a second elastic element, with a greater elastic constant than the first elastic element, to carry the automatic movable contact into contact with the printed circuit.
