Abstract (en)  
[origin: EP0223726A1] 1. Facade section for cast iron boilers, of the section boiler type comprising two facade sections (front-rear) and a multiplicity of heating sections, the said facade section having a substantially rectangular shape and being forecast to be placed vertically at the front or the rear of the boiler body, the longitudinal sides of the said facade section being placed vertically and the cross sides horizontally, the said facade section fixing methods issued straight from foundry without tooling with the said facade section and being forecast for the fixing of the boiler fittings, such as flue nozzle, cleaning door, casing, hinge, is characterized in that the fixing methods (4, 7) have two edges (4) perpendicular to the facade plane and extending continuously along each of the longitudinal sides and on the whole length of the said facade section, each edge (4) having a multiplicity of bores (5) forecast to bear fixing fittings, these bores being opened and coming out on the free border of edge (4) and placed in order to make the fixing axes be horizontal.
