Abstract (en)
[origin: EP0224205A2] A wooden product (P) molded in a desired shape is produced by a method which comprises admixing wooden fibers (W2) resulting from digestion and disintegration of wood chips (W1) with a binding agent such as a synthetic resin, a water repellent, a mold release agent or other additive, directly supplying the consequently formed ligneous molding material (M) to a molding die (30) of the desired shape without being first converted into a mat, and effecting hot compression molding of the ligneous molding material in the die.
