Abstract (en)

[origin: US4722369A] The cloth take-up device comprises a pressing device having a flexible pressure hose which is connectable to a pressure source and which presses a presser on to the cloth take-up roll. The pressure applied by the presser to the roll can be varied in a simple manner by variation of the pressure in the pressure hose and adapted to varying operating requirements. Delicate materials are taken up gently when a pressing roll driven at the peripheral velocity of the take-up roll is used.
