Abstract (en)

[origin: DE3631860A1] In order to reduce costs for the support of rolls in a rolling mill, the thrust bearing of one roll is arranged in its own, separate housing, which remains in the rolling stand when the roll is changed, and the rolls are thus changed only with their chocks, which accommodate the radial bearings. In operation, the thrust bearing housing is fixed axially by a retaining ring which can be locked to the end journal of the roll. When the roll is removed, the unlocked retaining ring and the thrust bearing housing must be supported in the removal position in the rolling stand.
