Abstract (en)
[origin: EP0227022A2] In this device, uncertainties previously occurring in the case of operation occurring manually by key and/or electromechanically or also automatically by means of in-built resetting magnets are to be eliminated. This is done in that a drive preparation rack, supported on the same shaft together with resetting rack and drive bridge, swings, under the action of a spring, against the switching drives still engaged after the resetting operation has begun, which drive preparation rack swings along with the steady preparation of the switching drives until, when the zeroing or resetting device is carried back after completed resetting, shortly before the basic position is reached and when the switching drives are engaged again, it lifts away in order to release the latter. <IMAGE>
