Abstract (en)
[origin: EP0229867A1] 1. Method of producing a structure using supporting sheets which consist of an inner and an outer sheet (4, 11) and whose distance from one another corresponds to the desired wall thickness of the structure, in which arrangement a baseplate (1), e.g. of concrete, corresponding to the shape of the structure in outline is produced first, then the water-tight and air-tight outer and inner sheet (4, 11) corresponding to the desired shape of the structure is arranged on this baseplate (1), the outer sheet (11) is secured in a sealing manner to the outside of the baseplate and is inflated, and finally a free-flowing structural material is introduced into the intermediate space between the inner and outer sheets (4, 11), characterized in that the inner sheet (4) put onto the baseplate (1) is inflated and the outer sheet (11) is arranged on the inflated inner sheet (4), structural material then being poured into the space between the inflated inner sheet (4) and the supported outer sheet (11).
