Abstract (en)

[origin: EP0231843A2] In a method for automatically adding meterable quantities of active washing-agent substances W1 to W5 into the liquor of a lye container of a program-controlled washing machine, it is important to ensure, among other things, that the quantities of active substance supplied are calculated in terms of the quantity of water required for washing or the average lye temperature in the lye container. This will be done before the lye has assumed its final state. For this, the quantities of active substance are added to the liquor in portions at predetermined times whenever it has been determined from a measurement during the particular time that a specific step towards the desired state value has been reached. <IMAGE>
